## Important Reminders

Please continue to submit Help Desk tickets through the Self-Service Portal or by calling the Help Desk 888-827-7728.

## Frequently Asked Questions

- NEW:** Can I batch print the patient labels/wristband sheet for the patients on the schedule?
- Batch printing of the patient labels/wristband sheet is unavailable. It is recommended to only print the patient labels/wristband sheets for patients receiving medications, as this will decrease paper waste in the office.

# Pathways to Our Future

## Barcode Medication Administration

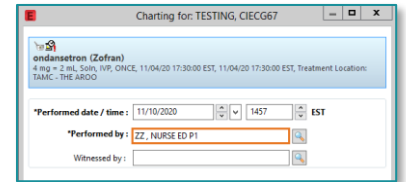

### Go-Live Flash

November 11, 2020

---

If two MA's give vaccine injections to a pediatric patient at the same time, how can each of them follow the BCMA process?

- Best practice would be to have one MA sign into the EHR, scan the patient barcode and scan the vaccine medications into the Medication Administration Wizard (MAW).
- Proxy charting can then take place for the vaccines that were not administered by the original MA that is signed into the EHR.
- To do this, open the medication administration window, and click the magnifying glass within the \*Performed by: search field.
- Search for the clinical staff's name that administered the medication.
- Click OK.

Fluoride is not scanning. Can I bypass it?

- Please submit a help desk ticket so Clinical Informatics can work with Pharm IS to create a barcode for easy scanning at the time of administration.

Do allergy injections get scanned?

- Do not scan allergy injections. Allergy injections are not considered medications. Please continue with your current documentation process.

How do I access the current BCMA flyers?

- For BCMA project education, please refer to the BCMA process flyers [here](#).

When I scanned a state supply vaccine, the following alert fired, “The soln (no charge) is different from the medication scanned soln.” What should I do?

- State supplied vaccines should always be scanned, as the NDC barcode *may* be scannable for the state supplied vaccines.
- If not, please follow this process:
  - Open the Medication Administration Wizard (MAW).
  - Scan the patient barcode identifier.
  - Bypass the medication barcode scan.
  - Address missing information, if applicable.
  - Administer the medication.
  - Sign.

Is there a way to scan the Lot Number and Expiration Date using the Medication Administration Window for vaccines?

Yes! If the package has a QR  square, the Lot Number and Expiration Date can be scanned. This code contains the medication AND lot number/expiration date information. Use this barcode instead of the “old fashioned”  barcode to expedite documentation.

Three scans are needed to use the QR square to document lot number and expiration date:

SCAN #1: Patient identifier barcode/QR square.

SCAN #2: Vaccine’s QR  square. This fills-in the medication time and dosage fields.

SCAN #3: Vaccine’s QR  square again. This fills-in the lot number and expiration date.

**NOTE:** If the “old fashioned”  barcode is scanned (vs. the QR square) the QR square will not populate the Lot number and Expiration Date.
